

Study on contributing factors of IMR and MMR in Tea Gardens of Assam -2015 Phase – II

Phase-2: Report of 390 Tea Gardens

Conducted by:

*Regional Resource Centre for North Eastern
States (a branch of NHRSC), Ministry of Health
and Family Welfare, Govt. of India, Guwahati,*

Study Team

Dr. Bamin Tada	Director
Dr. Himangshu Bhushan	Ex. Director RRC-NES
Dr. Joydeep Das	Sr. Consultant, Public Health
Dr. Hitesh Deka	Sr. Consultant, Public Health

Coordinator and Report Generation:

Mr. Bhaswat Kr. Das	Consultant, HMIS (Regional Coordinator)
---------------------	---

Field Supervisor:

Dr. Biraj Kanti Shome	Consultant, Community Mobilization (Regional Coordinator)
Ms. Rita Pradhan	Consultant, Training & HR
Ms. Arpana Barman	Consultant ,Community Mobilization
Ms. Sagarika Kalita	Consultant, HMIS
Mr. Neeladri Bora	Consultant, Public Health
Mr. Diganta Sarma	Consultant, Community Mobilization, Assam
Mr. Devajit Bora	Consultant, Community Mobilization, Arunachal Pradesh
Dr. Sukamal Basumatary	Consultant (Public Health Planning), Meghalaya
Dr. Supratim Biswas	Consultant, Community Mobilization, Tripura
Mr. Khagen Dutta	Consultant, Community Mobilization, Mizoram
Ms. Gayatri Devi	Fellow

INTRODUCTION:

Assam is the highest tea producer state in the country with 55% of the total production. About 20% of the total population of the state belongs to the tea growing communities. There are many studies on the health status of the tea garden community regarding maternal and child health, nutritional status and health assessment of the community by the national and international organizations. All those studies revealed that the nutritional status of these communities is poor and amongst the tea tribe population anaemia, hypertension, malnutrition and diarrhoeal diseases are major contributing factors to morbidity resulting in high maternal and infant death.

Various factors are responsible for frequent outbreaks of diarrheal diseases like lack of proper sanitation facilities and safe water. These are identified as critical gaps in the worker's residential lines. While provisions of these facilities are made by the Tea Garden management, they are sporadic, not used and not maintained properly and also in many cases the assets (toilet) are damaged. The unclean or submerged drainage system in many of these lines (during monsoon) becomes a serious public health risk. The lines are inhabited by regular workers and casual workers/non workers. An estimated 40% of the populations in the worker lines are casual workers/non workers. Thus, even if, the Tea garden managements manage to provide the facilities, the actual beneficiaries are only about 60% of the total population, thereby a large number of households remain under-served. This population is deprived of basic health care facilities adding to high disease burden and mortality rate. Also, as per the Annual Health Survey 2012-13, it was observed that as compared to the MMR of Assam (301), there was highest maternal mortality ratio (MMR) i.e. 404 in upper Assam Region (Dibrugarh, Jorhat, Sivsagar & Tinsukia) which comprises of maximum numbers of tea gardens in Assam.

STUDY OBJECTIVES:

Considering the fact that a large section of the population in the tea garden areas are yet to be covered by the tea garden management and also the MMR figures of the AHS 2012-13, the Govt. of Assam felt the need to assess the root cause of high Maternal and Infant death in the tea garden areas.

It is seen that the clinical causes of maternal and infant deaths are almost same all over the country and hence one of the important factor for its improvement is the availability of the services at the nick of time and the behavior of the community to access these available services.

Therefore, the prime objective of the study to assess the availability of the health care facilities in the Tea Garden Hospitals in Assam and the behavior of the community to access the services along with their socio economic status.

The broad objectives of the study were:

- Assessment of tea garden hospitals in terms of infrastructure, human resources with training, availability of different services with diagnostic facilities, equipment and drugs etc.
- Assess the service delivery outcomes of tea garden hospitals.
- Behaviour of the pregnant mother to access the available services in terms of ANC, Delivery, PNC, referral transport and Immunization etc

METHODOLOGY OF THE STUDY:

The study was conducted in two phases based on the number of workers in the pay roll. Of the total 781 registered tea gardens in Assam as per the Tea Board of India, 381 tea gardens, having more than 500 workers were covered during the first phase of the study. Therefore, total target for the second phase of the study was 400 tea gardens; of which 390 tea gardens were surveyed. 10 Nos. of tea gardens could not be surveyed due to some unavoidable circumstances. These 390 tea gardens were spread out in 16 districts of Assam.

The target group for the study were:

- ***The tea garden hospitals:*** all the hospitals available in each of the 390 tea gardens.
- ***Mothers who delivered a baby in last one year during the survey period:*** 8 Nos. of mothers from each of the 390 tea gardens were taken up for the study. However, in some cases the sample size was less than 8 mothers as the tea garden had less number of populations.

Tools of Data collection: Quantitative questionnaires were used for collection of primary data, while various records were referred for secondary data collection. Quantitative data were collected from the key informants using a structured interview schedule. The quantitative primary data were analysed using SPSS package.

Data collection process: A data collection team was formed for collection of the primary data. Each team comprised of 3 (three) investigators and 1 (one) supervisor and this team was expected to cover 2 tea garden hospitals per day. The supervisor collected information from the hospital and the investigator interviewed all the targeted mothers. In addition, the supervisor also coordinated the visit, checked and validated the filled up format and supervised the performance of the investigator.

Study period: The study period was from October 2015 to December 2015 and the final report was generated on January 2016.

Constraint of the study: Additional time required for inter district movement of the team and also holidays in between data collection period due to Durga Puja and Diwali, 60 days were required to complete the data collection

MAJOR FINDINGS OF THE SURVEY:

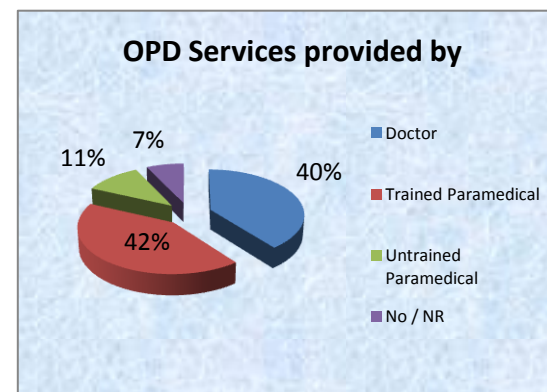

Tea Garden Hospitals: The findings majorly comprise of the available facilities in the tea garden hospitals.

- A total number of 390 tea gardens were surveyed and out of these only 281 (72%) gardens have hospitals of their own. In Dibrugarh district only 56 Nos. (53 %) of tea gardens have health facilities out of 104 surveyed.

Availability of the health facility by population of the Tea Garden				
Population covered	Yes	No	No Record	Total TG surveyed
Nil / No Hospital	12	85	5	102
Up to 500	78	17	-	95
501 to 1000	60	2	-	62
1001 to 2000	66	-	-	66
2001 to 3000	25	-	-	25
3001 & above	40	-	-	40
Total	281	104	5	390

- It is seen that nearly 37% tea gardens have less than 100 permanent workers and there were around 35% of tea gardens with less than 100 temporary workers. It is also observed that nearly 10% of the gardens have permanent workers in the range of 201 to 300, 301 to 500 and above 500. Nearly 25% tea gardens covered population up to 500. Only 10% gardens have population more than 3000. This data implied that less number of pregnant mother as well as infants were available in the tea gardens.
- The study also tried to find out the nearest Govt. facility from the Tea garden area. It is observed that the nearest government health facility in around 50% of the tea gardens is the PHC.

- Illiteracy amongst the tea tribe community is high (52% of mothers), which paly an important role in health seeking behaviour.
- No display of any messages in the health facility was found. Only 9% health facilities displayed OPD timings and only 1% facilities displayed fee structure though 59% facilities are free from any fees.
- Only 40% health facilities provided services through doctor where one third is weekly visiting doctors. Further, in 11% of the tea garden hospitals the services were provided by untrained paramedical staff. It is also observed that 69 tea garden health facilities provided IPD services and in 18 facilities IPD services are non functional.
- Trained manpower is one of the crucial factors for reduction of maternal and infant death. Only few facilities have trained manpower i.e. 7 in SBA, 4 in NSSK, 2 in BeMOC and 5 in F-IMNCI. From the study it is visibly evident that lack of trained manpower is one of the prime causes of maternal and infant death in the tea garden area. The fact that trained manpower and availability of specific services are correlated is seen here as only few facilities provided ANC, PNC & immunization services.
- Only 5 Nos. of tea garden hospitals have cold chain points and only 12 Nos. have laboratory facilities.
- The study also reveals that of the 281 tea garden having hospital facility only 76 (around 27%) of them have labour room. Further of these 76 numbers of tea gardens with labour room only around 63% of them are functional.

- Shortage of manpower in health sector of Assam is big issue and is true for Tea Garden Hospitals also. Out of 281 health facilities, only 11 specialists i.e. Medicine or Surgeon or O&G are available in 8 health facilities. In 91 facilities general doctors (Allopathic) are available; in addition to this number 40 facilities have weekly visiting doctors.

Total Permanent worker by Doctor	Medical Officer (Allopathic)			Total TG Hospital
	1 No.	2 No.s	Visiting	
Nil / No Hospital / No record	3		1	10
Up to 100	18	1	12	85
101 to 200	16	1	6	55
201 to 300	8		11	45
301 to 500	23		8	50
500 & above	20	1	2	36
Grand Total	88	3	40	281

- From the above table it can be easily interpreted that only 22 doctors are available out of 36 tea gardens where permanent worker is more than 500. As usual pattern, numbers of doctors are decreasing as workers are decreasing.
- 182 out of 281 facilities have ANM, 191 facilities have Pharmacist and 152 facilities have Health Assistant. It is also found that, total 345 ASHAs cover 244 tea garden hospital areas.
- The study also tried to find out few specific services related to maternal and child health in the tea garden hospitals. It is seen that in 66 Nos. of the tea garden hospitals, ANC is provided by them and in another 106 health facilities it is provided by service provider from the nearby Govt. health facility. It is also found that, 47 facilities (16.6%) conducts

normal delivery. Similarly, 63 tea garden facilities provides immunization services by themselves and in 113 facilities immunization services is provided by the service provider of the nearby Govt. health facility.

- Regarding referral services, it is available in 179 facilities where 125 facilities have ambulance and 48 facilities have patients carrying vehicle.
- An encouraging scenario is observed regarding drugs as 264 facilities provided free drugs where 247 facilities provided it to temporary workers also. In 60 facilities sources of drugs was both tea garden management as well as Govt. also.

Mothers in the tea garden lines: The findings comprise of the health seeking behaviour of the mothers.

- A total of 1960 mothers having been surveyed. The overall average mean age of the mothers surveyed was around 24 years of age and the average mean age at marriage was around 19 years. *However the average Hb level was found to be 9.3% which is below average.*
- As regards to the indicators related to household of the mothers, it was found that for majority of the mothers (58%) the source of drinking water was tube well/ bore well. Only 40.5% of them have toilet facility and only 21.7% of them have BPL cards.
- Overall it is seen that around 78% of the mothers have MCP cards with them and around 88% of the mothers had gone for 3 ANC. The consumption of IFA tablet during pregnancy was also found to be around 99%. However, the consumption of IFA tablets is not seen to be proportionate to HB level, which may be due to the non intake of IFA tablets of required doses.
- Around 16% of the mothers reported of having home delivery. Further, though around 17% of the health facilities conducted deliveries but amongst the mother only 11% of them had delivered in the tea garden hospital.

- Overall, the nutritional status of tea garden community is poor, which is reflected in case of pregnant mothers too and is a cause of concern for maternal as well as infant death. Low birth weight of baby is one of the major causes of infant deaths. The average weight at birth of the baby is found to be 2.6 kg which is near to the low weight baby.
- The disturbing factor was seen in initiating the breastfeeding within one hour as only around 64% of them were found to be following this practice.
- The involvement of ASHAs in house hold visit post delivery as per the HBNC scheduled was found to be less as the average number of days visited by ASHA within 42 days of delivery was found only to be around 4 days only.
- Many studies have established that high blood pressure among the tea garden community due to intake of extra salt. But the record for measurement of BP in pregnant mothers is missing in almost all MCP card as well as in the prescriptions. Follow up of these highly prone groups to maternal death are missing in the tea garden area.

Other Observations:

- Most of the tea garden hospitals are manned by trained paramedicals. Doctors, though posted at the tea garden hospital are available but their frequency of visit is too low, which hampers the quality of health care services and also management of cases.
- Most of the tea garden hospitals only provide first aid care services. Proper recording of case records were not seen.
- Baseline data related to maternal and child care including delivery, post delivery, immunization status of the children etc of their respective area was not found. It was reported that these data are kept and updated by the respective ANMs/ ASHAs.As such, it badly affects the follow up of the cases by the Tea Garden Hospital.

- Village Health and Nutrition Day are being conducted in the Tea Garden areas, however, it is usually done by the Health Department and the tea garden hospitals are hardly engaged in it.
- The HMIS report which basically incorporates the service delivered by the respective health facility is not updated regularly. Further, the Tea Garden Hospitals are not aware of submitting the HMIS report on a monthly basis.
- Performances of the Tea Garden Hospitals are also seen to be reflected by the ANM in the SC report and vice versa, which leads to multiple reporting of the same data.
- IEC initiative at the Tea garden areas is almost nil by the tea garden management or from the state.
- A hidden fact was observed in the tea garden area that many tea garden authority had not encourage activity of ASHA's like HBNC during working hour. ASHA's are also faced difficulty in performing HBNC as most of the pregnant women or mothers are in field during the day time. Another hidden fact is that most of the mothers do not know about their pregnancy at early stage or disclose their pregnancy. Lose of daily wages may be the factor for it.
- AWCs are available in the tea garden area, but the convergence with health care system is lacking. It affects growth monitoring of child.

Recommendations:

- Provision of making available of trained manpower for providing the health care delivery services.
- Proper record keeping both for case management as well as the baseline data and the performance of the facility.
- Training of available manpower both in health care delivery services and record keeping.
- Robust IEC initiatives at the tea garden areas, targeting mainly the illiterate lot for their healthy behaviour. Taking red tea with gigerly or sugar need to be insist in stead of intake of extra salt in red tea should one of the prime activities under IEC/ BCC programme.
- Involvement of the tea garden hospital staff in the VHNS.
- Tea Garden management should support ASHA for providing their support to the beneficiaries.
- TG authority should encourage involvement of ASHA in tea garden area. And also need to be relaxation from the services to pregnanat mother and mothers with baby to avail ANC, PNC immunization etc services.
- Tea gardens with good numbers of female workers must create creche where child upto 5 years can be kept.
